

Pipeline

Agent: DeepSeek V4 Flash (Think Max)
 Embedding: OpenAI Text Embedding 3 Small
 Academic Citations: OpenAlex API
 News Citations: Exa AI API

User Experience	Backend Pipeline
Input uncited essay content and select bibliography/in-text styling in a chat-style format.	Pass citation instructions and full essay to Agent for citation formatting preparation.
Highlights sentences that will require citations and indicates to the user in the essay. Indicates to user how many Cites will be required, and if there is not enough, prompts user to top-up either by paying or watching a certain amount of ads.	Comb through the essay using Agent to find all points that would require evidence.
Indicate to the user with a status bar of what the Agent is doing, such as searching for citations, matching results, etc. It gives a real-time status bar of which one out of the total sentences it is searching for. The main view will be dominated by an video ad, which will be embedded into the chat itself but you cannot scroll away from it. The user will still be able to see the status bar of their citation generation, but the main object will be the ad.	Query sentences into OpenAlex in standard keyword search and retrieve top 15 results.
	Use Embedding to generate arrays of the OpenAlex results and the particular user point.
	Compare results using a cosine similarity formula to find the best matching results, and if not above the threshold of 0.75, run a search with Exa.
	Verify Exa result to be above 0.75 threshold, and return an error message if a high reliability citation cannot be found.
Display necessary citation information to the user, such as indicating when an in-text citation is added in the essay. Also show a new citation added to the reference list, which is linked to all the citation metadata for that particular source in the database. The final output of the chat result should be a their essay with new in-text citations (if needed), and a full bibliography.	Run user sentence and selected citation result through Agent, and verify whether they match, and suggest a correction to the user sentence if not to ensure accuracy in user's text.
	Return sentence correction if needed, as well as all the metadata needed for a full citation and in-text references to be processed and stored. From OpenAlex, this will include authors, title, source (journal name), publication date, doi/url, volume, issue, and page. From Exa, this will include authors, title, publication date, url, and source (which will be parsed from url using tldts)
	Agent uses final information to implement an in-text citation in essay in selected style, as well as a fully formatted reference in bibliography. Store all citation metadata in the bibliography database for reference.
